

Experience True Hybrid Cloud

Avande Solution for Microsoft Azure Stack

Enterprises that embrace cloud technologies discover that they must deploy both public and private cloud solutions to meet specific business needs. Often this means supporting multiple technologies and duplication of effort. With Microsoft Azure Stack software, we provide a turnkey solution and help organizations build, run and innovate on private cloud services in a manner that is consistent with the way they would in the public Azure cloud.

Benefits of the Avanade Solution for Microsoft Azure Stack

- **Meet business and technical requirements**, with the flexibility to choose the right combination of public cloud and private cloud
- **Focus on building applications that differentiate your core business** while consuming managed cloud services deployed in an on-premises environment
- **Gain efficiency in application development, testing and deployment** by leveraging a single development platform and using the applications the same way whether they run on Azure or Azure Stack
- **Increase your ability to meet governance and compliance requirements** while leveraging public cloud technologies in an on-premises deployment

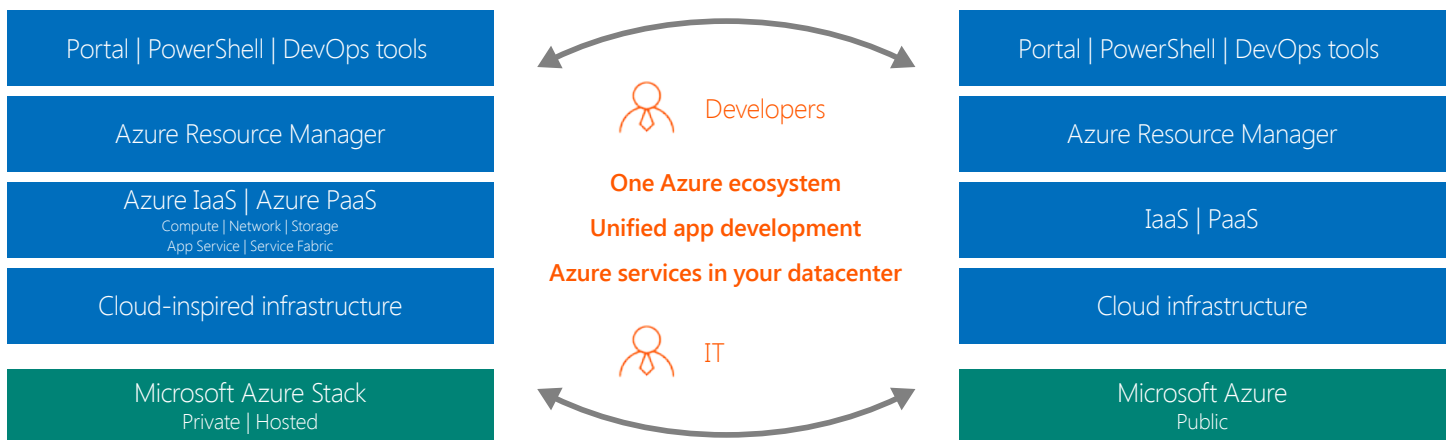

Why businesses deploy Azure Stack

Preparing to move to the public cloud: For many companies, the move to the cloud is imminent but they aren't ready to take that next step. With Azure Stack you can prepare for migration and run applications in a private cloud on-premises and then migrate when the time is right.

Edge and disconnected solutions: Address latency and connectivity requirements by processing data locally in Azure Stack and then aggregating in Azure for further analytics, with common application logic across both.

Modern applications across cloud and on-premises: Apply Azure web and mobile app services, containers, server-less and microservice architectures to update legacy applications with Azure Stack, while using a consistent DevOps process across on-premises and cloud.

Cloud applications that meet every regulation: Develop and deploy applications in Azure, with full flexibility to deploy on-premises with Azure Stack to meet regulatory and policies requirements, with no code changes needed.

Consistent experience to build, run and innovate on cloud

What is the Avanade Solution for Microsoft Azure Stack?

Avanade provides a turnkey, managed Azure Stack solution. Through a single provider, you get a Microsoft certified hardware platform, Azure Stack software setup and configuration, a hybrid cloud foundations workshop, and then we run and manage it for you. The solution can be deployed on-premises, in a third-party location or hosted in Avanade's data centers. Azure Stack enables a true hybrid IT cloud model by allowing companies to deploy Azure-consistent functionality in a private environment.

Enterprises must embrace cloud to keep pace with business demands

In a recent [Avanade IT modernization study](#), nearly two-thirds (65%) of respondents agree that conventional systems and approaches in use today are not fit for purpose for meeting the emerging requirements of the digital business. CIOs realize they need to take a cloud-first approach to their IT systems, but the public cloud may not be the right solution for all applications. In that same study, respondents indicated that over the next three years organizations will move more and more from on-premises to cloud (IaaS from 14% today to 30%, and PaaS 8% today to 25%), creating a hybrid IT world. To date, this has meant deploying multiple platforms as it has never been possible to deploy public cloud technology on-premises.

Public cloud options may drive private cloud adoption

One of the most basic challenges of leveraging public cloud technologies is getting access to the cloud itself. Some organizations find themselves operating in areas where latency and connectivity issues prevent them from using public cloud applications. Other organizations have found that their governance and compliance requirements can't be met with a public cloud solution. For those forced into a private cloud solution, the options available to date have been complex to deploy and manage. Additionally, they lacked a consistent API, development tools and processes. This means that businesses wanting to deploy cloud technology on-premises would duplicate efforts to support applications on the public cloud and on-premises.
